Blue tesla pill report 2019

You can try to access this site from a secure browser on the server. Enable scripts and reload this page. Yesterday it was announced that Boomtown will not have drug safety test kits available this year. In light of this, it is probably best to keep an eye on the most dangerous MDMA tablets to avoid. The Loop, a not-for-profit company that offers drug care and harm reduction services at clubs and festivals, has just released its annual report on the highest strength pills circulating this summer. With Boomtown and Houghton being held this weekend and Creamfields at the end of the month, it's more important than ever to read on which pills to look out for and avoid. This summer, The Loop has already participated in Kendal Calling and Parklife, but won't be testing at some festivals, including Boomtown, so you'll have to be smart about your own strength. Purple and pink Skype Purple and pink Skype pills were found in Kendal Calling and Parklife and have been linked to multiple hospital admissions. They are high strength with 250-300mg of MDMA, which is three times the common dosage for adults, which is 100mg. Side effects of these pills include nausea, muscle spasms, excessive sweating, blurred vision and chills. Brown Donkey Kong Donkey Kong are brown pills that have been tested in Kendal Calling. They contain 250 g of MDMA, more than twice the recommended dose. The effects of these tablets include visual hallucinations, agitation, hypertension, convulsions and the risk of developing a coma. Orange and white Sprite Orange and white sprite pills were tested in Manchester and found to have 300mg of MDMA per pill. There are orange and white pills with an NL seal and a dividing line on the back. Side effects include nausea and muscle spasms. Purple Maybach Maybach are purple pills with 220 – 240mg of MDMA, almost twice the average adult dose found in Kendal Calling. Side effects include increased heart rate, blurred vision, rapid breathing and clenching of teeth. Orange Superman The Loop say these orange Superman tablets are PMMA, which is essentially acrylic glass and not good for you. They were found in Boomtown. Yellow Technogym Yellow technogym pills containing more than 200mg of MDMA. The pill has a break line at the back with a small surrounded NL. Blue Punisher Blue Punisher pill found at Love Saves the Day in Bristol. This pill has been found to contain more than 300mg of MDMA, which is almost three times the recommended dosage. The purple Audi This purple Audi pill contained between 260 and 310mg of MDMA during testing. Brown Phillip Plein's Brown Phillip Plein pill was found online. It is a bright peach brown color or dark brown, with a skull on the back and no dividing line. It also features the Phillip Plein logo style on the front. After testing, this pill had 170 – 230mg of MDMA as well as high variability. Trump Orange Trump pill is orange and had 260 mg of MDMA during testing. However, it has a high volatility. Orange Superman These orange orange Logo pills have been found in Boomtown this year and contain PMMA, which is more poisonous than mdma and ecstasy and comes with a higher risk. These increased risks include overheating, organ failure and heart failure. Pink Putin This Putin pill is pink in color and has the shape of Vladimir Putin's face. During the tests we found that 280mg of MDMA #harmreduction is our mission, our motto & our mantra! Here are the top 10 strength pills tested by Loop this summer, all 200+ mg of MDMA. These pills, like most tested by Loop in 2019, contain a 2+ x average dose for adult MDMA. Take care of each other! #StartLowGoSlow pic.twitter.com/05AKpVgQcW — Loop (@WeAreTheLoopUK) August 5, 2019 Each drug The Loop warned people against contains more than 200mg of MDMA, well above the common dose of 100mg. The strongest pill is the yellow and white Technogym pill, which has 330mg of MDMA. Avoid taking any of the tablets on this list. Boomtown organizers also warned about the effects of using multiple drugs at the same time and the serious dangers of drug abuse, including prescription drugs. Loop recommends that you seek medical help if you feel unwell at any time. This can lead to very dangerous effects on an individual's health, especially if they are not aware of how strong this form of ecstasy is. Traditionally, ecstasy has been a substance used at all-night dance parties in clubs, as reported by the National Institute of Drug Addiction (NIDA), but they have continued to develop, telling us that this use is now more widespread. Ecstasy is a synthetic substance that is comparable in composition to both hallucinogens and stimulants. It creates a feeling of euphoria, greater energy, emotional warmth and distortion of time and sensory perception. Ecstasy can be taken in pill or capsule form, and can even be soured or taken as a liquid. People who take ecstasy may also use it in accompaniment with other substances such as marijuana or alcohol. As Ecstasy affects the brain and body according to the Drug Enforcement Administration (DEA), ecstasy works to increase three brain chemicals, resulting in the following changes: Dopamine — Increased levels of this neurotransmitter cause feelings of euphoria and increased energy. Norepinephrine — These changes are responsible for increased heart rate and blood pressure, which is especially worrying for those who have existing cardiovascular problems. Serotonin - This chemical mood, appetite, sleep and other functions. This increase is probably responsible for a sense of emotional intimacy and that accompany this drug use. In addition to these changes in neurochemist disease, ecstasy can affect overall health, causing: Blurred Vision Chills Nausea Muscle Spasms Involuntary Teeth Cramping Sweating Because the effects of ecstasy only last about three to six hours, individuals can take a second dose before the impact of the first has a chance to disappear. It additionally compounds the dangers of this drug, some of which can cause serious and even life-threatening side effects. NIDA continues to tell us that higher doses of ecstasy can raise the body's temperature in a capacity that can, in some cases, cause organ failure, particularly kidney, liver or heart failure, which can prove fatal. In addition, the tendency of ecstasy to create a sense of self-confidence and closeness with others can lead to dangerous sexual practices, which can increase the chances of transmission of hepatitis or HIV/AIDS and unintended languages. According to the Mayo Clinic, ecstasy can also cause extreme and sometimes fatal cases of hyponatremia, a condition that occurs when sodium levels in the body drop too low. Finally, it is important to remember that every time you combine a drug with another drug, as is common practice for ecstasy, the risk increases even more. Orange Tesla Ecstasy: What You Need To Know in an article published by news website Drive, drug organizations have issued a recent warning about ecstasy tablets with the Tesla logo. The orange pills of a Tesla are orange in color and are formed in the shape of a shield. This particular drug use is common at festivals and raves (often held in clubs) because the pill shines under blacklight, a quality that is believed to make the pill easier to find if it is dropped or lost. The orange tesla contains about twice as much as MDMA compared to other forms of pills people usually take to reach high. As stated in Drive, Tesla forms of ecstasy have been common in the present decades, but this new form has seen an increase in usage due to higher power. As Reported by Mixmag, tesla orange pills contain 240 mg of MDMA, while other forms typically contain 125-130 mg. To raise awareness of drug safety, The Loop, a drug safety nonprofit, spreads the message on social media. They urge individuals taking tesla to be very careful with this pill, and take a reduced dosage. Remember, any drug, in any amount, even a smaller dose, puts the user at risk. A completely drug-free life is the only way to really make sure you are safe from these dangers. Ecstasy: According to NIDA, a 2004 study found that more than 11 million people in the United States have tried MDMA at least once. One of the glaring risks associated with this illegal use of is the fact that many people mistakenly believe that it is a safe drug to take. An unfortunate number of people who take ecstasy believe it is not addictive, and when taken in small enough doses that is not harmful. Although the results differ on whether ecstasy can cause addiction, according to NIDA, studies have confirmed that people who are affected by long-term use of ecstasy may experience serious health problems, including cognitive deficits (memory problems). One of the major risks associated with taking ecstasy is that it can be sold to people who do not realize it contains substances other than MDMA, one example being bath salts. These ingredients can be harmful when ingested, especially if the person taking ecstasy is not aware that the pill contains these additional chemicals. Even without a clear answer about the potential for addiction, long-term memory damage and effects on overall health (such as those listed above) can be detrimental to those affected by ecstasy use, and the illegal use of the pill that causes such effects cannot be ignored. Finding answers Some people often go to clubs and festivals. This is something that many people, adults and teenagers, do to relax and relax from everyday life. This in itself is not bad, however, it can be too easy to get involved at the moment and take the pill offered in easy company, not taking into account the dangers you are opening up to. In the case of ecstasy, especially orange Therapy, this decision can be very harmful to health and well-being. If this pill is mixed with a substance that can be harmful to the body, like bath salts, the results can be disastrous. Don't be part of the ecstasy epidemic. While ecstasy may or may not be addictive, it can have a serious impact on health. If you or someone you know takes ecstasy regularly or in any capacity, we can help you overcome this harmful use.
